Contributors: Kevin, Luisa, Pascual, Roman, Vinh

Start with everyday life

- ❖ Tell a believable situation from a shop, hobby, club or community. Build a small tool for a named type of user.

CS077 Week 5 / Reflection 1: From Story to Product

Status: Context selected / preparation record. This does not verify completion, attendance, grading or Canvas submission.

Context: Continue your runner

Receipt: 3d566649-9255-4f26-8ccf-ba5d571e36f0

Selected: 2026-09-23T17:12:08.773Z

Requirements version: 2026-09-20.1

Who is your user?

Roman

What do they need to do?

Create a checklist

What is the smallest useful result?

"Checklist for {name}"

One hat switch and its reason

Hat switch to user and added An image/animation of a ball/ball bouncing.

What changed after testing? What comes next?

The program became more visually appealing and user friendly.

GitHub repository URL

Requirements for your runner's tool

R1 / Extract a product from your story

Name your setting, user, situation and one need. Explain the smallest useful app. Continue your existing story or choose another setting, save the selection receipt with the project.

R2 / Plan before coding

Keep the whiteboard story/flowchart, values and types, class/control responsibilities, and your PowerPoint prototype. Show one peer-driven change and explain when you switched Visual, Logical and Data hats.

R3 / Build one working WPF application

Start blank. Include labeled input, a button and a visible result. Use a condition, a bounded loop and a custom method. Explain MainWindow/control objects and a small array used in your app or the companion exercise.

R4 / Make the interface usable

Apply your prototype's layout. Include relevant imagery, an image-plus-text button, organized asset folders and a short opt-in sound with a no-sound route. Record asset sources, check labels, keyboard and resizing.

R5 / Create the illustrated how-to manual

Submit an editable manual and PDF with your own screenshots: purpose, setup, build steps, code explanations, media, tests and run/use directions. Include the required verified AI record, Attention First application and a short reflection.

R6 / Keep accepted 5A and 5B evidence

Include both meetings' whiteboard/shared planning and concise Discord peer checks. Attendance and active participation require instructor verification. Reuse class evidence; do not create duplicate reports.

R7 / Submit the GitHub repository URL

Commit and push your source/assets, PPTX, manual/PDF, selection receipt and evidence. Retain 5A/5B checkpoints and a final push. Verify instructor access and submit the link in the Week 5 Canvas assignment.

Complete every requirement. Attendance and participation are required: Actions 5A and 5B must both be accepted before Week 5 is accepted for grading. If you miss a meeting, contact the instructor about an approved arrangement under the syllabus and applicable accommodations. Canvas controls dates and grades; browser checkboxes do not verify attendance.

[Complete Quick Start](#) [Open the Week 5 Canvas assignment](#)

Submit the tested GitHub repository link through the Week 5 Canvas assignment. This record does not submit it for you.

Planning

PowerPoint Prototype

From a concept to a visual representation of our working app.

Goal:

- ❖ Have the ball bounce on the user's screen.

Visual studio

GitHub Repo

Week 05

(4) App, Docs, Evidence, Planning

App/StoryProduct

Commit work

- ❖ Organizing folders and correctly placing each file into the appropriate folder creates a readable structure.
- ❖ This helps both the user and reader clearly understand the information being relayed.

24/7
Collaborative
environment

Build from a Blank WPF File

Connect the Behavior

Recap the understanding of the code and the concepts from 5A + 5B.

My story checklist

Name

Build my checklist

Ready,

5A – Verifies that it is ready to build checklist

My story checklist

Name

Build my checklist

Ready,

5B – Takes it one step further. It has the user verify their name input.

Stopping the loop.

`index < tasks.Length`
stops the loop

- ❖ 0, 1, 2 will run since they are all < 3 .
- ❖ The length of the loop stops because $3 < 3$ is false.
- ❖ The return statement leaves immediately and gives a value back.

index	<code>index < 3</code>	Result	What happens
0	$0 < 3$	True	Loop runs
1	$1 < 3$	True	Loop runs
2	$2 < 3$	True	Loop runs
3	$3 < 3$	False	Loop stops

Assets (Visual + Audio)

Give the app its own visual identity

We used artificial intelligence to create a visual model representation of a ball bouncing. This is stock image placeholder.

Test it & teach someone else

For example:

If user enters "h" it will
automatically capitalize it.

Name:

Name:

In this step we decided to have the user be able to input anything and have the text automatically be capitalized.

Evidence

Package the same work

This PowerPoint compiles our entire work into one presentable visual manner. All files for this PowerPoint are located in Week 05's GitHub Repository.

In this week's module we have used our entire skillset that we have learned since the beginning of the class. This includes using AAA and the SEEK framework to establish storytelling and creative design. Also, it includes all the fundamental concepts we have covered: classes, loops, arrays, strings and several other C# fundamentals. After testing our team's work, we learned how to troubleshoot GitHub and how to work together to bring one idea to fruition. Moreover, we learned where we went wrong and took the time to reflect on how to move forward. The next steps in development would be repeating the framework to decide how to grow the app and what concepts need to be revisited.

Write a short reflection:

One visual element that we can improve on moving forward is the aesthetic design of the UI presented to the user. Everything has to be clear to the user. One logical element that we can improve on moving forward is the goal for the user and us as the developers. One data element we can improve on is ensuring that we peer review each other's work to ensure that not only we can follow along, but other programmers can follow our code as well. Overall, we can continue improving by releasing updated version that build upon previous versions. User feedback will be able to dictate and facilitate which areas need to be improved.
