CS077 / WEEK 6

Capture Utility Selection Receipt

Status	Pathway selected
Pathway	Build for Your Own Story
Reason	A person in your world needs a captured image that preserves visual information before an event changes, disappears, or becomes difficult to prove.
Receipt ID	CS077-W6-ORIGINAL-584E0BB0
Requirements version	2026-09-27.5
Selected	2026-10-28T19:12:24.044Z
Event or situation	The Ashwake terminal is sending out an encrypted signal.
Intended user	The crew member is responsible for decrypting the signal.
Capture target	The crew member must get the decrypted signal.
Why now	The terminal has crucial information that is needed for the crew.
Risk or privacy boundary	Do not capture personal information or passwords.
Useful output	A clearly named image file is saved in the mission evidence folder.

Contextual requirements

1. R1 - Select and explain one capture need
   Selected context: Build for Your Own Story. Reason: A person in your world needs a captured image that preserves visual information before an event changes, disappears, or becomes difficult to prove. Choose one pathway. Submit its required story position and treatment, original backstory and treatment, or technical project brief. Name the user, capture target, urgency, useful output and risk. Backstory and treatment: Describe the setting, user, event, urgency, captured information, intended result, and the risk created by losing or sharing the image.

2. R2 ★ - Complete the gatekeeping and ethics work
   Selected context: Build for Your Own Story. Reason: A person in your world needs a captured image that preserves visual information before an event changes, disappears, or becomes difficult to prove. Read Attention First pages 25-29 and submit workbook page 117, Attention Economy and Ethics Audit, based on your screen-capture project. This is a starred requirement. Apply the audit to this reason: A person in your world needs a captured image that preserves visual information before an event changes, disappears, or becomes difficult to prove.

3. R3 - Plan before coding
   Selected context: Build for Your Own Story. Reason: A person in your world needs a captured image that preserves visual information before an event changes, disappears, or becomes difficult to prove. Include the Context-to-Utility map, whiteboard interface and code flow, privacy boundary, and PowerPoint prototype. Show one peer-driven interface revision. Prototype the story-specific screen-capture utility and use the interface labels “Capture the Record” and “Image preserved” as examples or replace them with equally clear labels.

4. R4 - Build the Windows Forms capture utility
   Selected context: Build for Your Own Story. Reason: A person in your world needs a captured image that preserves visual information before an event changes, disappears, or becomes difficult to prove. Create one C# Windows Forms app that captures the screen, previews or holds the bitmap, lets the user choose a save location, saves a PNG and shows visible result status. The finished app must make the story-specific screen-capture utility usable for the intended user.

5. R5 - Organize and explain the C#
   Selected context: Build for Your Own Story. Reason: A person in your world needs a captured image that preserves visual information before an event changes, disappears, or becomes difficult to prove. Use consistent names, a button Click event, focused methods and an appropriate capture class or service. Explain important variables, objects and resource handling. Add useful comments and three specific TODO items. Explain how the code supports the selected capture purpose rather than only repeating syntax definitions.

6. R6 - Test the routes
   Selected context: Build for Your Own Story. Reason: A person in your world needs a captured image that preserves visual information before an event changes, disappears, or becomes difficult to prove. Record expected and observed results for successful capture and save, cancelled save, blocked or invalid destination, and another capture. Preserve exact errors and the next test when something fails. Test the utility under the selected context and record any context-specific risk.

7. R7 - Keep accepted 6A and 6B evidence
   Selected context: Build for Your Own Story. Reason: A person in your world needs a captured image that preserves visual information before an event changes, disappears, or becomes difficult to prove. Include both meetings' whiteboard or shared planning and concise Discord peer checks. Attendance and active participation require instructor verification. Reuse class evidence; do not create duplicate reports. The 6A and 6B evidence must show progress on the same story-specific screen-capture utility.

8. R8 - Submit the receipt and tested GitHub repository URL
   Selected context: Build for Your Own Story. Reason: A person in your world needs a captured image that preserves visual information before an event changes, disappears, or becomes difficult to prove. Download the pathway receipt. Commit and push it with the source project, pathway brief, prototype, README, screenshots, test record, AI record, ethics audit and reused class evidence. Test instructor access and submit the GitHub repository URL through Canvas. Include the backstory and treatment and selection receipt in the final repository.

This receipt records the selected pathway and requirements. It does not establish completion, attendance, submission or a grade. Return the tested GitHub repository URL through the official Week 6 Canvas assignment.
